Third Session: Urban Computing - Data visualization

Table of Contents

1. Part 1: Data visualization fundamentals
 - Perception
 - Data types
 - Visual mapping
2. Part 2: Visualizing spatio-temporal data
 - Visualizing space
 - Visualizing time

Part 1: Data visualization fundamentals

What is data visualization?

Data visualization

"Data graphics visually displaying measured quantities by means of the combined use of points, lines, a coordinate system, numbers, symbols, words, shading, and color"

Edward R. Tufte

What is visualization

- We define visualization as the communication of information using graphical representations.
- Qualities of a visualization¹
 - Truthful
 - Functional
 - Visually pleasing
 - Insightful
 - Enlightening

¹Alberto Cairo. *The truthful art: Data, charts, and maps for communication*. New Riders, 2016.

Who do you visualize for?

Depends on the purpose:

- Exploratory data visualization
- Explanatory data visualization

Table of content

1. Part 1: Data visualization fundamentals

- Perception
- Data types
- Visual mapping

2. Part 2: Visualizing spatio-temporal data

- Visualizing space
- Visualizing time

Perception in Visualization

Perception is the process of recognizing, organizing, and interpreting sensory information.

- Attentive (controlled)
- Pre-attentive (uncontrolled)

Example: in the picture to be shown, count the number of threes and raise your hand when done.

How many numbers of 3 you see in this picture?

18374806380364294148944327065225658875347787454
14889032707545480172808753871247432245672375231
02355321789986322457900888231806234358759923682
45642329893423508912127456534589964580473325868
97452419894123124560077650975322346873202423891

How many numbers of 3 you see in this picture?

18374806380364294148944327065225658875347787454

14889032707545480172808753871247432245672375231

02355321789986322457900888231806234358759923682

97452419894123124560077650975322346873202423891

Answer: 28

Sometimes perception issues are more complicated than that...

Example two: Try to guess the ratio between the bigger picture and the smaller shape ...

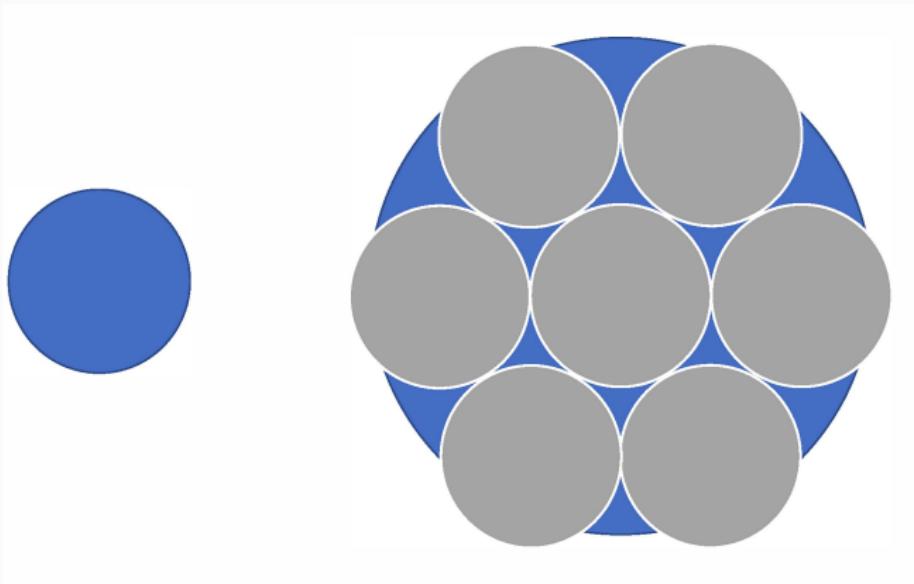

What is the ratio between the bigger and the smaller circle?

What is the ratio between the bigger and the smaller rectangle?

What is the ratio between the bigger and the smaller circle?

What is the ratio between the bigger and the smaller rectangle?

Table of content

1. Part 1: Data visualization fundamentals

- Perception
- **Data types**
- Visual mapping

2. Part 2: Visualizing spatio-temporal data

- Visualizing space
- Visualizing time

Visualization basics: Data

- Visualizing is about mapping data to the right visual attribute
- Data
 - Nominal
 - Ordinal
 - Quantitative
- What matters a lot is the operations we can apply on data. A good visual attribute helps us keep those operations.

Nominal

- Categories
- Names

Mary
John
Jack

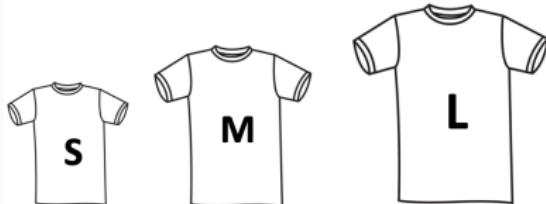

Ordinal

Categorical data type where the variables have natural, ordered categories and the distances between the categories is not known

Disagree Neutral Agree Strongly agree

Freshman
Sophomore
Junior
Senior

Quantitative

- Discrete $\{i \in \mathbb{N}\}$
- Continuous $\{i \in \mathbb{R}\}$

Quantitative continued

- Some distance metric can be defined
- You cannot divide them, ratios don't mean anything

Sun	Mon	Tue	Wed	Thu	Fri	Sat
17	18	19	20	21	22	23
24	25	26	27	28	Mar 1	2
3	4	5	6	7	8	9
10	11	12	13	14	15	16
17	18	19	20	21	22	23
24	25	26	27	28	29	30

1. Part 1: Data visualization fundamentals

- Perception
- Data types
- Visual mapping

2. Part 2: Visualizing spatio-temporal data

- Visualizing space
- Visualizing time

Visual mapping

- How to map data to visual attributes such that operations are perceived visually ...
- What visual attributes you know?

Visual encoding- Jacque Bertin

Figure 1: Jacque Bertin 1918-2010

2

²<https://en.wikipedia.org/wiki/Jacques-Bertin>

Jacque Bertin

- Bertin presents the fundamentals of information encoding via graphic representations as a semiology (sign systems)
- **Visual encoding** is the process of mapping data into visual structures
- Bertin's graphical vocabulary:

Marks	Points, lines, areas
Positional	Two planar dimensions
Retinal	Size, value, texture, color, orientation, shape

Jock Mackinlay

A portrait of Jock Mackinlay, a middle-aged man with short, light-colored hair and glasses, wearing a dark polo shirt. He is gesturing with his right hand, pointing towards the camera. The background is a plain, light-colored wall.

Jock Mackinlay

Director of Visual Analysis
Tableau Software

Quantitative data

Position

Length

Angle

Slope

Area

Volume

Color saturation

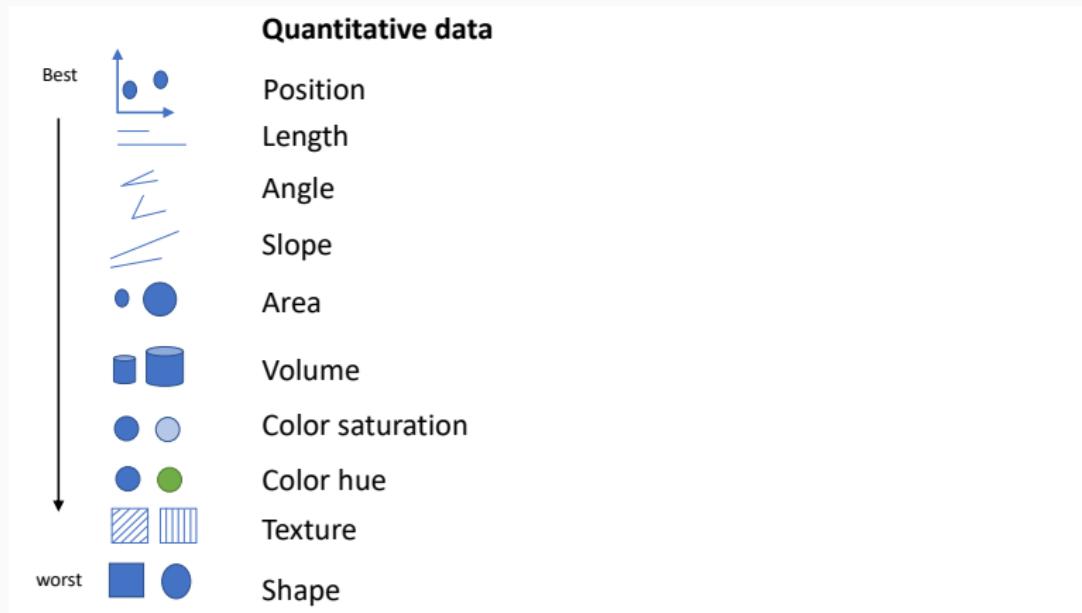

Color hue

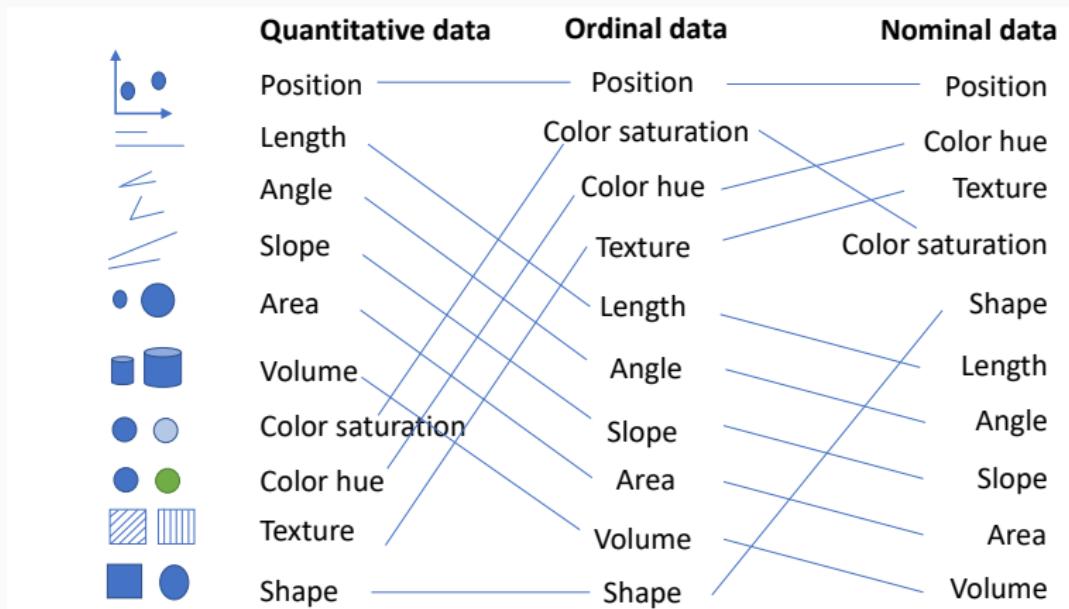

Texture

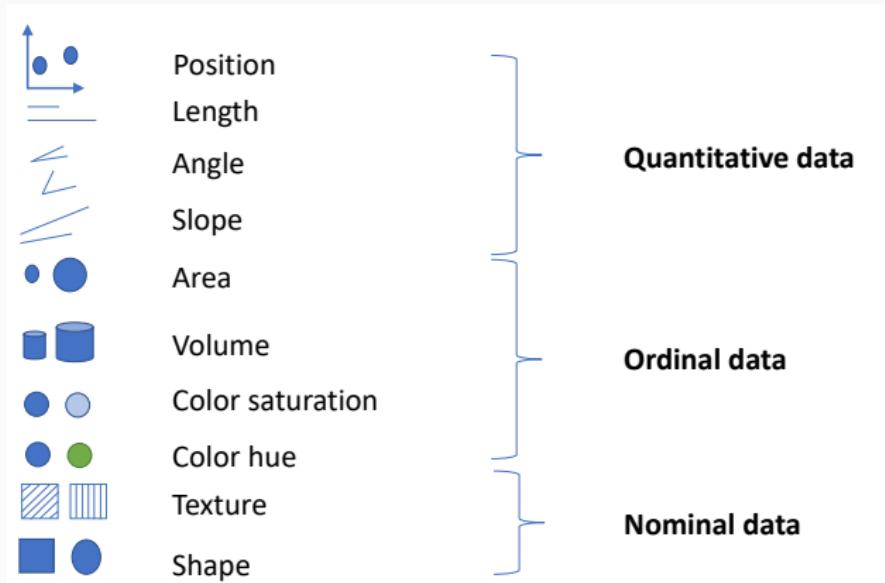

Shape

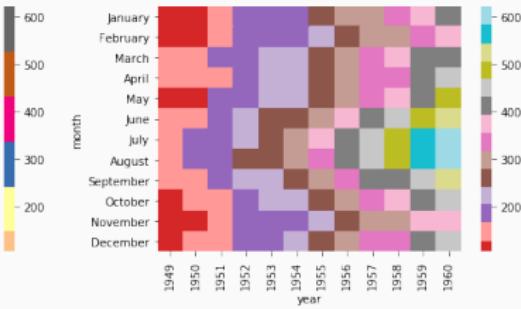

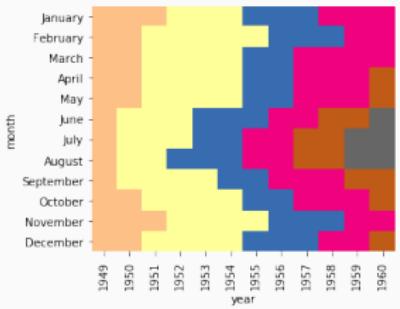

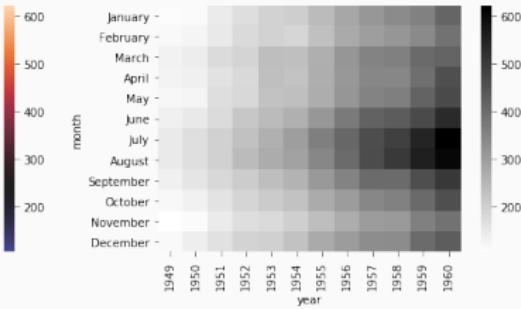

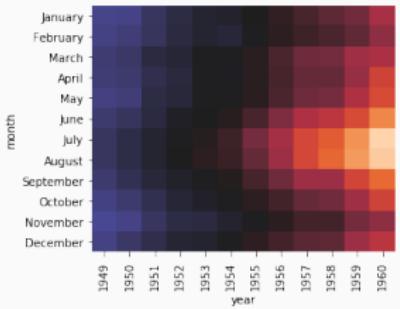

Visual mapping

Not only useful for visual designers but also for designing automatic visualization algorithms

Example

Which one is more efficient?

Part 2: Visualizing spatio-temporal data

Table of content

1. Part 1: Data visualization fundamentals
 - Perception
 - Data types
 - Visual mapping
2. Part 2: Visualizing spatio-temporal data
 - Visualizing space
 - Visualizing time

Visualizing geo-spatial data → Making maps (Cartography)

A bit of history on maps

Figure 2: First attempts in analysing spatio-temporal data. The indigenous people also made their own maps of the Spanish conquest, in the form of a lienzo

John Snow?

John Snow? ³

³<https://nl.wikipedia.org/wiki/John-Snow>

A bit of history

- Original map made by John Snow in 1854.
- Map of the deaths from cholera in London in 1854.⁴
- Each bar represents one deceased person

⁴ https://nl.wikipedia.org/wiki/John_Snow

A bit of history

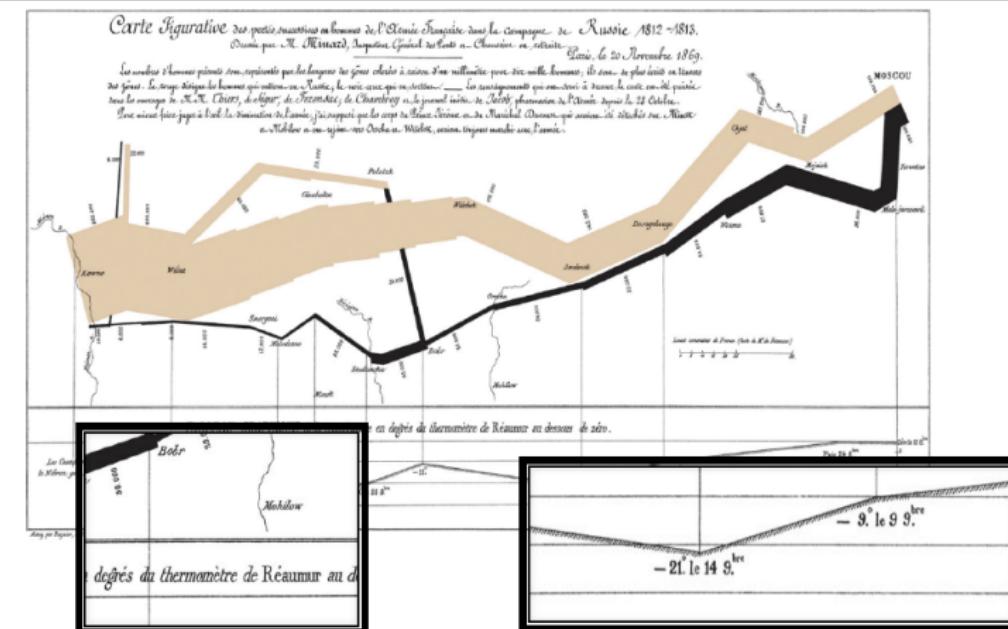

Figure 3: The map of Napoleon's Russian campaign

5

⁵source: https://en.wikipedia.org/wiki/Charles_Joseph_Minard

Visualization technique for geo-spatial data

- What is so difficult about making maps?

The orange effect⁶

⁶ Image source: www.profdrikageografia.blogspot.com/2010_12_01_archive.html

Projections

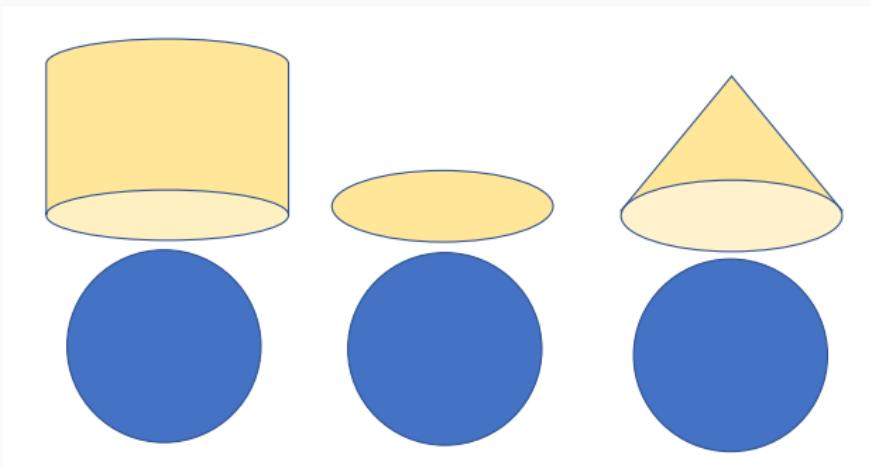

Figure 4: Methods of projection: Cylindrical, Circular, Cone

Map projection techniques

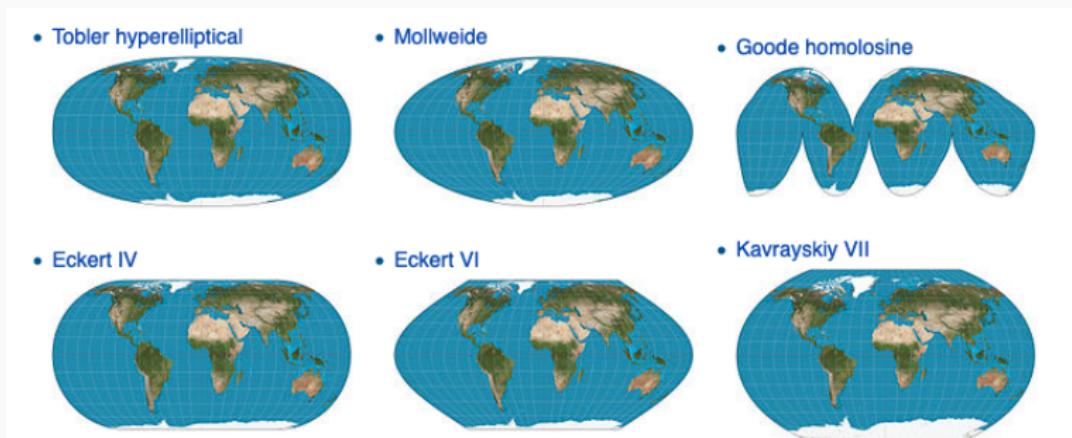

Figure 5: A number of pseudo-cylindrical map projection techniques

7 8

⁸ image credit Copyright ©[2011] [Daniel R. Strebe].

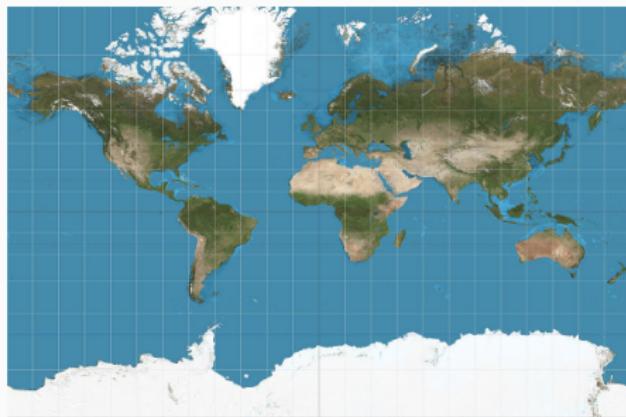

Attributes we would like to save in a projection

- Shape
- Area
- Angle
- Distance
- Direction

A projection can preserve one or two of these properties → At least three attributes will be sacrificed.

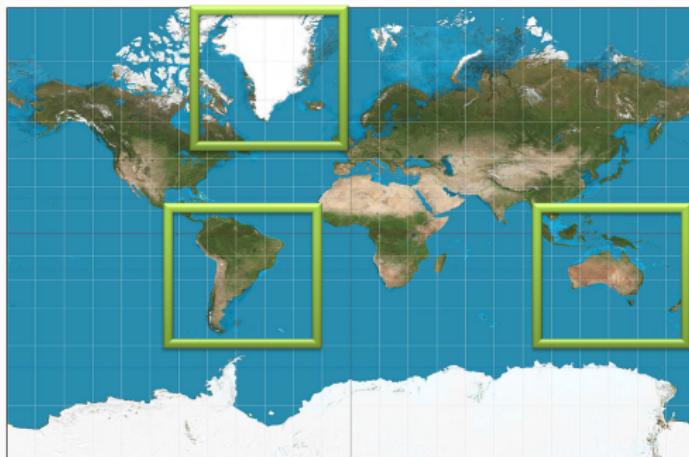

Merkator projection

Mercator projection is the de facto standard for web mapping applications (Open street maps, Google maps, etc.)

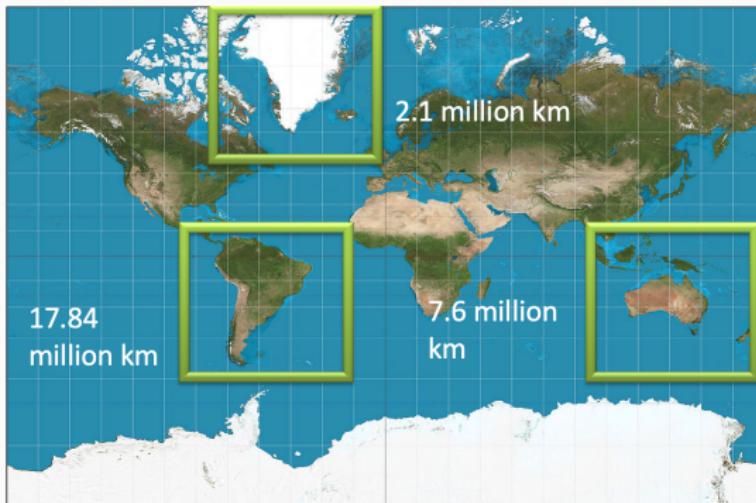

Everything near the equator is in the right size, the rest are not!

Merkator projection

Merkator projection

Which projection should you use?⁹

- Continental areas: Asia and North America
 - Albers equal-area
 - Lambert azimuthal
- Countries in mid-latitude
 - Albers equal-area
 - Lambert azimuthal
 - Cylindrical equal-area
- **Continental areas: Europe and Australia**
 - Albers equal-area
 - Lambert azimuthal
- Polar regions
 - Lambert azimuthal
- Continental areas: Africa and South America
 - Lambert azimuthal
 - Mollweide
 - Sinusoidal
- **Small countries**
 - Lambert equal area
 - Cylindrical equal area

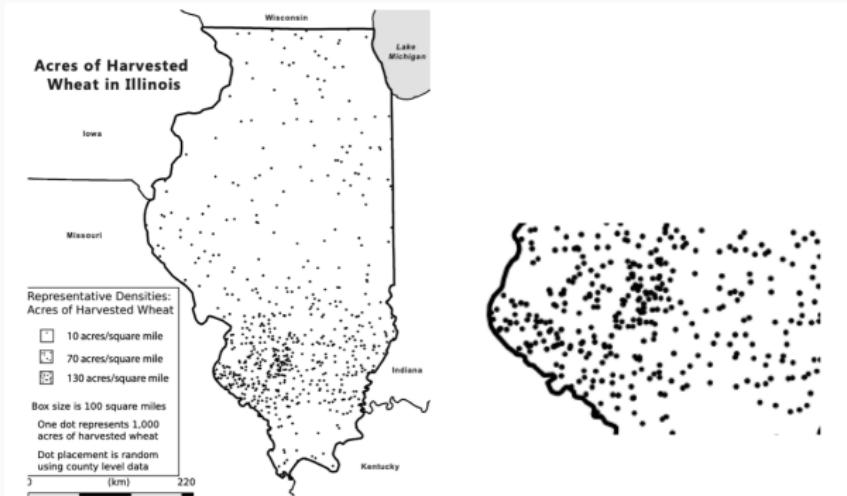

⁹Cairo, *The truthful art: Data, charts, and maps for communication.*

Example

Given a dataset with phone call instances, how will you show it on a map?

Longitude	Latitude
52.168141	4.470163
52.168341	4.470133
52.168335	4.470236
52.168828	4.471694

Example

Problem with dotmaps: if we draw a dot for every instance there will a large degree of overlap.^{10 11}

Visualizing area data

Thematic maps:

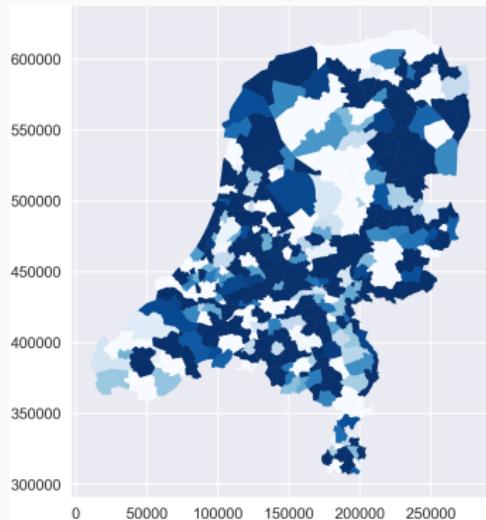

Figure 6: A choropleth map, colors mapped to numbers

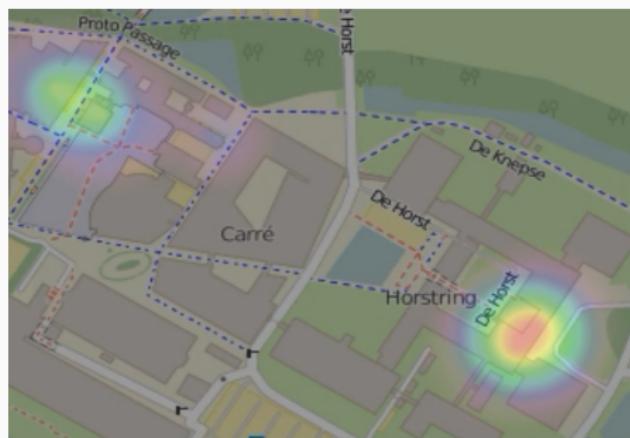

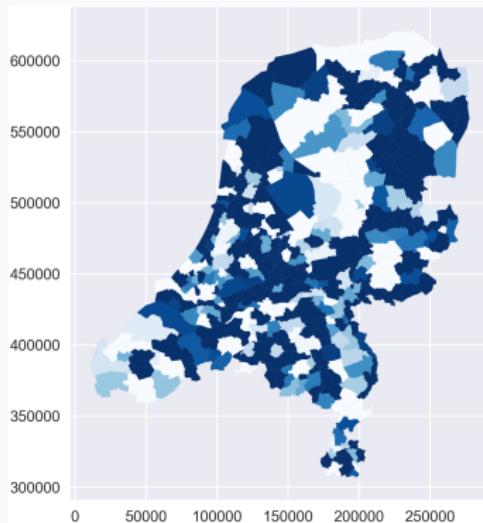

Figure 7: An isarithmic map showing the density of a variable

Choropleth maps (Area data)

A map which uses differences in shading, coloring, or the placing of symbols within predefined areas to indicate the average values of a particular quantity in those area

Choropleth maps (problems)

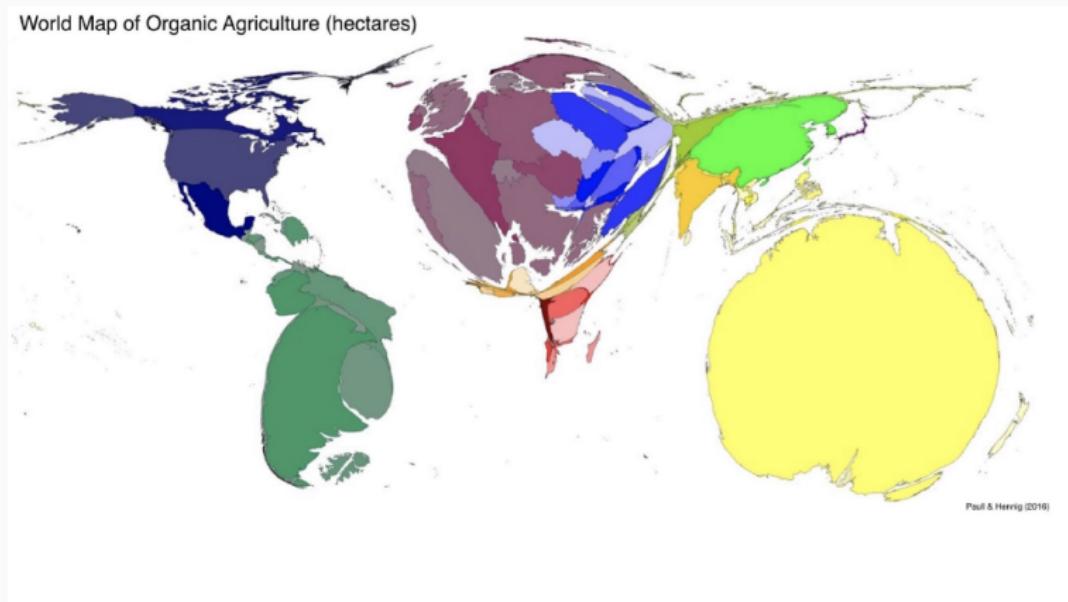

Problems with Choropleth maps

- Most interesting values are often concentrated in densely populated areas with small polygons. Less interesting values are spread over sparsely populated areas with large polygons.
- **Choropleth maps tend to highlight patterns in large areas, which may be of lower importance.**

Cartograms

Cartograms are generalizations of ordinary thematic maps that avoid the problems of choropleth maps by **distorting the geography** according to the displayed statistical value.

World map of organic agriculture (hectares)

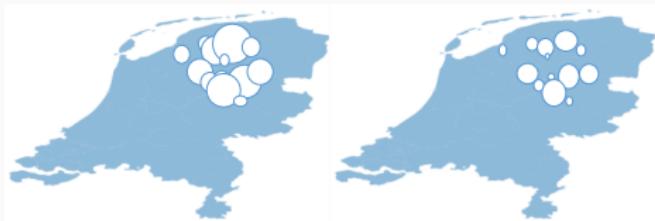

12 13

¹²image source: <https://en.wikipedia.org/wiki/Cartogram>

¹³image credit Copyright ©[2016] [John Paull and Benjamin Hennig]

Comparing areas of different size requires normalization

- Same data will yield different visualization when normalized considering population densities
- Normalize data before visualizing!

Points to consider in maps (perception problems)

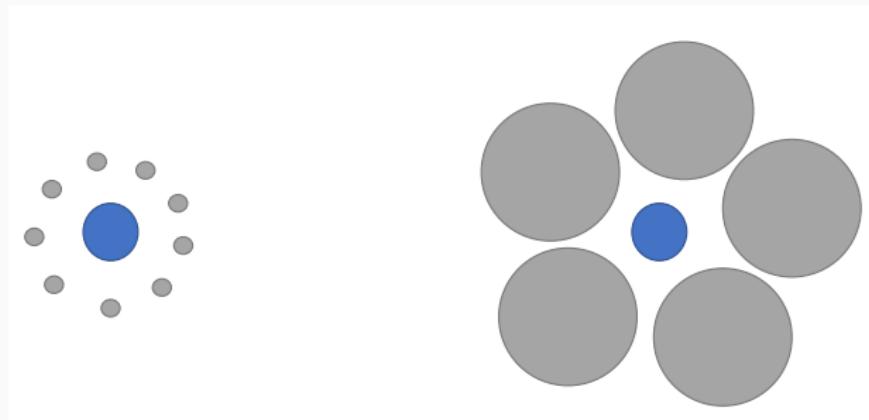

Figure 8: Ebbinghaus illusion

Points to consider in maps

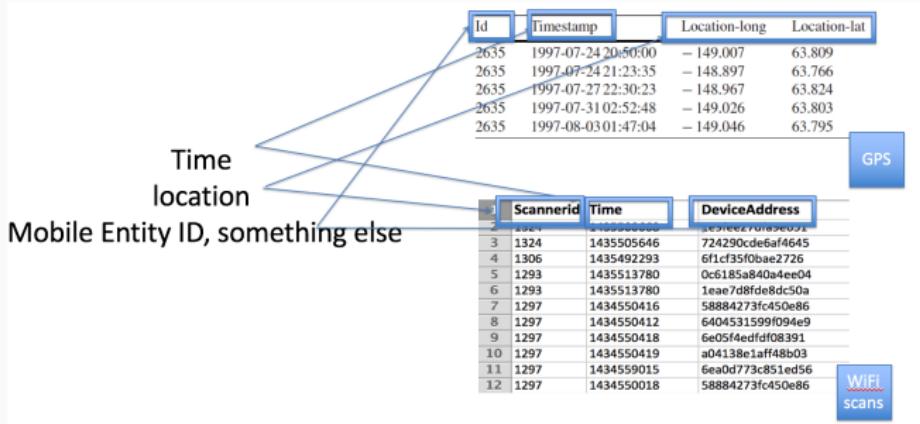

Figure 9: Overlapping points on maps, try to prevent the left image using normalization or transparent circles

Table of content

1. Part 1: Data visualization fundamentals
 - Perception
 - Data types
 - Visual mapping
2. Part 2: Visualizing spatio-temporal data
 - Visualizing space
 - Visualizing time

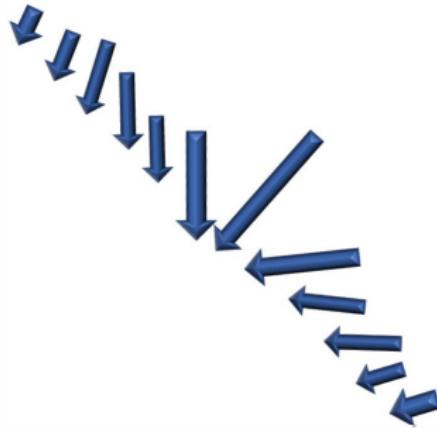

Spatio-temporal data

Visualizing spatio-temporal data

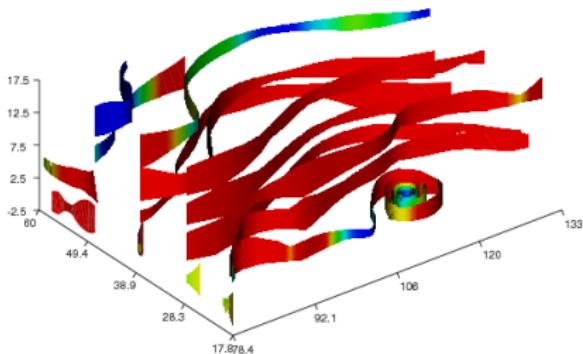

- How do you visualize spatio-temporal data?
- It is important to use techniques to allow focus on a specific phenomena in visualization
- Example of technique for visualizing temporal data:
 - Glyphs
 - Ribbons
 - Streaklines

Glyphs

Glyphs can have a direction and strength.

Ribbons

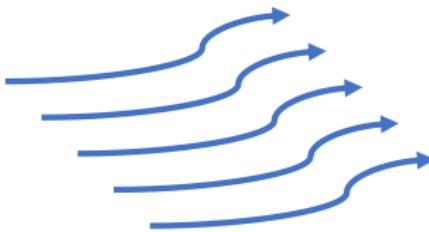

Flow data visualized using ribbons, vorticity can be mapped to twist.¹⁴

¹⁴ image source:<http://hplgit.github.io/scitools/doc/easyviz/easyviz.html>

See here

Streaklines

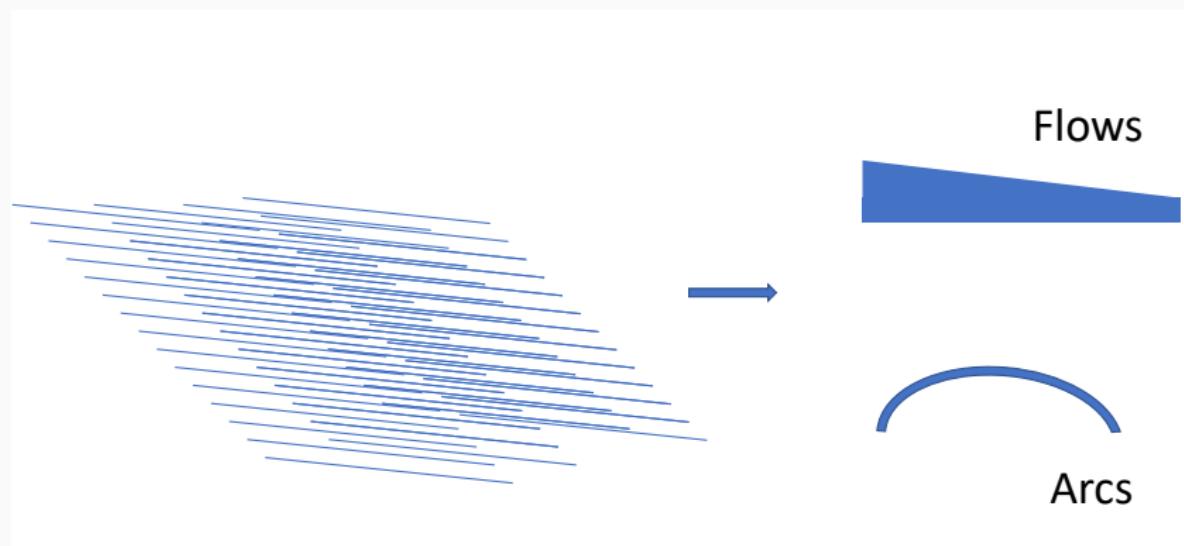

Points from a number of timestamps can be joined to form streaklines.

Visualizing flows on maps

How to deal with so many lines?

- Flow maps
- Arc maps

Lessons Learned

- Visualization of spatio-temporal data
- Projection techniques and important spatial attributes that need to be preserved (shape, area, angle, direction, distance)
- Challenges of presenting area data over area:
 - Dot plots, thematic maps, cartogram
- Visualizing the time by focusing on temporal aspects (glyphs, streak-lines, ribbons)
